6 LIST OF TABLES

# Chapter 1

# Introduction

This paper describes the work to write a chat front end that connects to a chat server via TCP. The chat server is usually abbreviated by CS, the user interface is called UI.

# 1.1 Description

The aim is to write a generic chat front end for a fictional chat server that accepts a given command set. In particular all parts of the communication are unambiguous and commands sent by either side are acknowledged from the other side.

# 1.2 Objectives

- 1. Research and define set of commands to be supported by chat server
- 2. Define protocol to be used between server and client
- 3. Define transport mechanism
- 4. Create prototype implementation for client and test with mock server
- 5. Present results in class

# 1.3 Expected Results

- 1. List of supported commands
- 2. Protocol definition
- 3. Description of the underlying transport mechanism
- 4. Source code including build and run instructions

5. Presentation

# Chapter 2 Protocol definition

# 2.1 Basic data types ("'EOFbdt"')

This section specifies the basic datatypes. They are further referenced as "'EOFbdt"'.

#### 2.1.1 The zero byte

The zero byte is a byte with the value 0.

#### 2.1.2 ASCII numbers

ASCII numbers use the decimal string representation of a number. ASCII numbers are often used in a packet header. ASCII numbers are used to specify the length of the packet (excluding itself). Due to compatibility of UTF-8 and ASCII, ASCII numbers may also be referred to as UTF-8 numbers.

#### 2.1.3 Strings in general

Strings are transmitted without termination (i.e. no new line, no 0 byte). The encoding to be used is **UTF-8**.

#### 2.1.4 Fixed length strings

Fixed length strings contain exactly the specified number of bytes: A 128-byte fixed length string consists of at most 128 bytes of text. If the text it contains is shorter than the specified length, it must be padded with zero bytes.

#### 2.1.5 Variable length strings

This protocol does not specify any variable length strings.

# 2.2 EOF simple data types ("'EOFsdt"')

The following sections define the simple datatypes. They are further referenced as "'EOFsdt"'.

#### 2.2.1 Command

A command is represented as an ASCII number in a fixed length string of 4 bytes. It is used to identify the intent of a message.

#### Examples

- 1100
- 3000
- 2200

#### 2.2.2 Identification string (id)

To identify a message, a message may contain an identification string, called the *EOFID*. This ID is an integer that is encoded based on the following characters:

- A-Z (alphabet in upper case)
- a-z (alphabet in lower case)
- 0-9 (the digits)
- ! (exclamation mark)
- - (minus)

The order of the characters is as follows:

 $\{0123456789 abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ-!\}$ . The length of an EOFID is 6 bytes, which results in 68719476736 possible ids. 1. The given characters where selected to allow easy debugging.

#### **Examples**

The following examples en- and decode integers into the specified format. Use is made of the Python reference implementation:

 $<sup>^{1}(10+26+26+2)^{6}</sup>$ 

```
>>> import ceof
>>> ceof.EOFID.int_to_id(42)
'00000G'
>>> ceof.EOFID.int_to_id(1)
'000001'
>>> ceof.EOFID.int_to_id(64)
'000010'
>>> ceof.EOFID.id_to_int('000010')
64
>>> ceof.EOFID.id_to_int('!!!!!')
68719476735
>>> ceof.EOFID.id_to_int('a----')
11794116542
>>> ceof.EOFID.id_to_int('000000')
0
```

#### 2.2.3 Size (size)

A size is represented as an ASCII number in a fixed length string of 6 bytes.

#### Examples

```
>>> import ceof
>>> ceof.fillup("10", 6)
'10\x00\x00\x00'
>>> ceof.fillup("10000", 6)
'10000\x00'
>>> ceof.fillup("100000", 6)
'100000'
```

#### 2.2.4 Peer name (name)

The peer name is a 128 byte fixed length string.

#### Examples

#### 2.2.5 Group name (group)

The group name is a 128 byte fixed length string.

#### Examples

>>> import ceof

#### 2.2.6 Message text (msgtxt)

The message text is a 256 byte fixed length string.

#### Examples

#### 2.2.7 Peer address (address)

The address of a peer, which is a 128 byte fixed length string. Peer addresses are specified as URLs as defined in RFC3986[1].

#### Examples

#### 2.2.8 Peer fingerprint (keyid)

A (PGP) fingerprint<sup>2</sup> is a 40 byte fixed length string. As the fingerprint has a fix length of 40 bytes, there is never padding needed.

#### Examples

% gpg --fingerprint | grep "Key fingerprint =" | sed -e 's/.\*=//' -e 's/ //g' A35767A98CA9CC3CE368679AB679548202C9B17D

 $<sup>^2 \</sup>mathrm{See}$  RFC 2440[2], 11.2. Key IDs and Fingerprints

# 2.3 Interface between the chat server and the user interface ("'cs2ui"')

This section specifies how the user interface (UI) communicates with the chat server (CS).

#### 2.3.1 Connection

The chat server provides a TCP listener on port 4242, to which the UI connects to. Alternate ports may be used, but need to be specified explicitly.

#### 2.3.2 Messages

All messages exchanged between CS and the UI are represented as a series of fixed length strings. Every message begins with an **eof command**. Messages send by the chat server use eof commands beginning with **11**, messages send by the UI use eof commands that begin with **21**.

#### 2.3.3 Message 1100: Acknowledge

This is a general acknowledge answer. The previous request from the UI with the same ID was successful.

#### **Parameters**

Table 2.1: Message 1100 parameters

| Parameter | Type       | Description | Example |
|-----------|------------|-------------|---------|
| ID        | EOFsdt: id | packet id   | afdb12  |

#### Example

1100abfudh

# 2.3.4 Message 1101: Failure

This is a general failure answer. The previous request from the UI with the same ID failed. Details are specified in the reason message.

Table 2.2: Message 1101 parameters

| Parameter | Type           | Description                  | Example                 |
|-----------|----------------|------------------------------|-------------------------|
| ID        | EOFsdt: id     | packet id                    | afdb12                  |
| Reason    | EOFsdt: msgtxt | Specifies the failure reason | Too many UIs connected. |

If the failed command was "'2100"', the CS will close the socket afterwards.

#### Example

>>> import ceof

>>> ceof.fillup("1101abfudhThe Error Reason", 4+6+256)

'1101abfudhThe Error

#### 2.3.5 Message 1102: Exit requested

This is a shutdown request to the UI. After this message, the CS will exit.

#### **Parameters**

Table 2.3: Message 1102 parameters

| Parameter | Type       | Description | Example |
|-----------|------------|-------------|---------|
| ID        | EOFsdt: id | packet id   | afdb12  |

#### Example

1102abf93a

#### 2.3.6 Message 1103: Received message

This message is issued by the CS if a message is received.

Table 2.4: Message 1103 parameters

| Parameter Type | Description | Example |
|----------------|-------------|---------|
|----------------|-------------|---------|

| ID      | EOFsdt: id     | packet id   | afdb12              |
|---------|----------------|-------------|---------------------|
| name    | EOFsdt: name   | The sender  | telmich             |
| message | EOFsdt: msgtxt | The message | Hallo, mein Freund! |

#### Example

- >>> import ceof
- >>> cmdid="1103abcdef"
- >>> name=ceof.fillup("telmich", 128)
- >>> message=ceof.fillup("Hallo, mein Freund!", 256)
- >>> cmdid + name + message

/x00/x00/x00/x00/x00/x00/x00,

#### Possible answers

• None

#### 2.3.7 Message 1104: List of peers

This is the answer to command 2106. It contains the same ID, as the 2106 request command.

Table 2.5: Message 1104 parameters

| Parameter | Type       | Description | Example |
|-----------|------------|-------------|---------|
| ID        | EOFsdt: id | packet id   | afdb12  |

| Number of peers (nop) | EOFsdt: size | How many peers follow | 20      |
|-----------------------|--------------|-----------------------|---------|
| nop*Peer              | EOFsdt: name | The name              | telmich |

The last field is repeated as many times as specified in the number of peers field.

#### Example

```
>>> import ceof
>>> cmd="1104"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> nop=ceof.fillup("2", 6)
>>> peer1=ceof.fillup("telmich", 128)
>>> peer2=ceof.fillup("Hans-Jürgen", 128)
>>> cmd + id + nop + peer1 + peer2
'1104Y7Spet2\x00\x00\x00\x00\x00telmich\x
```

#### 2.3.8 Message 1105: Peer information

This is the answer to command 2105. It contains the same ID as the 2105 request command.

#### **Parameters**

Table 2.6: Message 1105 parameters

| Parameter                 | Type            | Description          | Example              |
|---------------------------|-----------------|----------------------|----------------------|
| ID                        | EOFsdt: id      | packet id            | afdb12               |
| Keyid                     | EOFsdt: keyid   | This peers pgp-keyid | 389E5481065EAA253    |
| Number of addresses (noa) | EOFsdt: size    |                      | 2                    |
| noa*address               | EOFsdt: address | Adress of peer       | tcp://127.0.0.1:4243 |

The last field is repeated as often as specified in the number of addresses field.

#### Example

```
>>> import ceof
>>> cmd="1105"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> keyid="A35767A98CA9CC3CE368679AB679548202C9B17D"
>>> noa=ceof.fillup("2", 6)
>>> addr1=ceof.fillup("tcp://10.2.2.3:4242", 128)
>>> addr2=ceof.fillup("email://nico-eof42@schottelius.org", 128)
>>> cmd + id + keyid + noa + addr1 + addr2
'1105o0mZGMA35767A98CA9CC3CE368679AB679548202C9B17D2\x00\x00\x00\x00\x00\x00
/x00/x00/x00,
```

#### 2.3.9 Message 1106: Peer renamed

This is the answer to command 2104. It contains the same ID as the 2104 request command. It is sent out to all connected user interfaces.

#### **Parameters**

Table 2.7: Message 1106 parameters

| Parameter     | Type         | Description | Example |
|---------------|--------------|-------------|---------|
| ID            | EOFsdt: id   | packet id   | afdb12  |
| Old peer name | EOFsdt: name | Old name    | susi    |
| New peer name | EOFsdt: name | New name    | heinz   |

#### Possible answers

• None

#### Example

>>> import ceof

```
>>> cmd="1106"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> oldname=ceof.fillup("telmich", 128)
>>> newname=ceof.fillup("Another Name", 128)
>>> cmd + id + oldname + newname
/x00/x00/x00/x00,
```

#### 2.3.10 Message 2100: Register user interface

This must be the *first* message sent by the UI. If the answer is not 1100, the UI should close the connection afterwards.

#### **Parameters**

Table 2.8: Message 2100 parameters

| Parameter | Type         | Description    | Example |
|-----------|--------------|----------------|---------|
| ID        | EOFsdt: id   | packet id      | afdb12  |
| Name      | EOFsdt: name | Name of the UI | ceofui  |

#### Possible answers

- 1100
- 1101

#### Example

```
>>> import ceof
>>> cmd="2100"
>>> id = ceof.EOFID.int_to_id(42)
>>> name=ceof.fillup("ceofui", 128)
>>> cmd + id + name
```

#### 2.3. INTERFACE BETWEEN THE CHAT SERVER AND THE USER INTERFACE ("'CS2UI"')21

#### 2.3.11 Message 2101: Deregister user interface

#### **Parameters**

• none

#### Possible answers

• none

The CS will close the connection to the UI after receiving this message.

#### Example

```
>>> import ceof
>>> cmd="2101"
>>> cmd
'2101'
```

#### 2.3.12 Message 2102: /peer add

The UI adds a peer to the list of known peers.

#### **Parameters**

Table 2.9: Message 2102: /peer add parameters

| Parameter | Type            | Description                         | Example               |
|-----------|-----------------|-------------------------------------|-----------------------|
| ID        | EOFsdt: id      | packet id                           | afdb12                |
| Peer name | EOFsdt: name    | Name you identify the peer with     | telmich               |
| Address   | EOFsdt: address | Where we can make the first contact | tcp://10.0.42.42:4242 |
| Keyid     | EOFsdt: keyid   | PGP fingerprint of the peers key    | F27987E34E66          |

#### Possible answers

- 1100
- 1101

#### Example

>>> import ceof

```
>>> cmd="2102"
>>> name=ceof.fillup("telmich", 128)
>>> address=ceof.fillup("tcp://127.0.0.1:6667", 128)
>>> keyid="A35767A98CA9CC3CE368679AB679548202C9B17D"
>>> id = ceof.EOFID.int_to_id(42)
>>> cmd + id + name + address + keyid
```

#### 2.3.13 Message 2103: /peer del

A35767A98CA9CC3CE368679AB679548202C9B17D'

The UI wants to delete a peer.

#### Parameters

Table 2.10: Message 2103: /peer del parameters

| Parameter | Type         | Description                     | Example |
|-----------|--------------|---------------------------------|---------|
| ID        | EOFsdt: id   | packet id                       | afdb12  |
| Name      | EOFsdt: name | Name you identify the peer with | telmich |

#### Possible answers

- 1100
- 1101

#### Example

```
>>> import ceof
>>> cmd="2103"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
```

```
>>> name=ceof.fillup("telmich", 128)
```

#### 2.3.14 Message 2104: /peer rename

This messages is issued by the UI when it wants to rename a peer.

#### **Parameters**

Table 2.11: Message 2104: /peer rename parameters

| Parameter | Type         | Description   | Example |
|-----------|--------------|---------------|---------|
| ID        | EOFsdt: id   | packet id     | afdb12  |
| Old name  | EOFsdt: name | Old peer name | susi    |
| New name  | EOFsdt: name | New peer name | heinz   |

#### Possible answers

- 1106
- 1101

#### Example

```
>>> import ceof
```

>>> cmd="2104"

>>> eofid = ceof.EOFID()

>>> id = eofid.get\_next()

>>> oldname=ceof.fillup("telmich", 128)

>>> newname=ceof.fillup("Another Name", 128)

>>> cmd + id + oldname + newname

$$\label{lem:convol} \begin{align} \begin{al$$

<sup>&</sup>gt;>> cmd + id + name

#### 2.3.15 Message 2105: /peer show

The UI requests details about a peer.

#### **Parameters**

Table 2.12: Message 2105: /peer show parameters

| Parameter | Type         | Description              | Example   |
|-----------|--------------|--------------------------|-----------|
| ID        | EOFsdt: id   | packet id                | afdb12    |
| Peer name | EOFsdt: name | Name, as known by the CS | karl-otto |

#### Possible answers

- 1101
- 1105

#### Example

```
>>> import ceof
>>> cmd="2105"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> name=ceof.fillup("telmich", 128)
>>> cmd + id + name
```

# 2.3.16 Message 2106: /peer list

The UI requests the list of known peers.

#### 2.3. INTERFACE BETWEEN THE CHAT SERVER AND THE USER INTERFACE ("'CS2UI"')25

Table 2.13: Message 2106: /peer list parameters

| Parameter | Type       | Description | Example |
|-----------|------------|-------------|---------|
| ID        | EOFsdt: id | packet id   | afdb12  |

#### Possible answers

- 1101
- 1104

#### Example

```
>>> import ceof
>>> cmd="2106"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> cmd + id
'2106LGMsYS'
```

#### 2.3.17 Message 2107: /peer send

The UI wants to submit a message to a peer.

#### **Parameters**

Table 2.14: Message 2103: /peer send parameters

| Parameter | Type           | Description                     | Example                 |
|-----------|----------------|---------------------------------|-------------------------|
| ID        | EOFsdt: id     | packet id                       | afdb12                  |
| Peer name | EOFsdt: name   | Name you identify the peer with | telmich                 |
| Message   | EOFsdt: msgtxt | The message itself              | Hallo, wie geht es Dir? |

#### Possible answers

- 1100
- 1101

#### Example

```
>>> import ceof
>>> cmd="2107"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> name=ceof.fillup("telmich", 128)
>>> message=ceof.fillup("Hallo, telmich!", 256)
```

>>> cmd + id + name + message

#### 2.3.18 Message 2199: /allquit

The user interface requests that the CS and all other UIs exit.

#### **Parameters**

Table 2.15: Message 2199: /quit parameters

| Parameter | Type       | Description | Example |
|-----------|------------|-------------|---------|
| ID        | EOFsdt: id | packet id   | afdb12  |

#### Possible answers

- 1101
- 1102

#### Example

```
>>> import ceof
>>> cmd="2199"
>>> eofid = ceof.EOFID()
>>> id = eofid.get_next()
>>> cmd + id
'2199ff5N-j'
```

# Chapter 3

# Implementation

The implementation is realised with *Python 3* and makes use of the *ncurses* library for drawing the user interface. The chat server (CS) and the chat ui (UI) have been integrated into the **ceof** project, which aims to provide a *secure*, *peer-to-peer*, *decentralised anonymous chat system*. For this reason, the CS and the UI are implemented as subcommands of ceof:

# 3.1 Source Code Design and Location

The implementation is made in a typical Python way: The ui and the chat server are implemented in modules, which are included into the main program.

The chat server is implemented in src/lib/ceof/server/ui.py, the user interface is implemented in src/lib/ceof/ui/.

#### 3.2 Command line

#### 3.2.1 Chat Server

The chat server can change the listen address and the listen port. Both may be specified on the command line:

```
Select configuration directory ($HOME/.ceof by default)
-a ADDRESS, --address ADDRESS
Listen on this address for UI connections
-p PORT, --port PORT Listen on this port for UI connections

Get ceof at http://www.nico.schottelius.org/software/ceof/
```

The chat server can be started without any arguments:

(python-env)[10:33] brief:src% ./bin/ceof uiserver

#### 3.2.2 User interface

The user interface accepts address and port information for the chat server to connect to on the command line:

```
(python-env)[19:39] brief:src% ./bin/ceof ui -h
usage: ceof ui [-h] [-d] [-v] [-c CONFIG_DIR] [-a ADDRESS] [-p PORT]
optional arguments:
  -h, --help
                        show this help message and exit
  -d, --debug
                        Set log level to debug
  -v, --verbose
                        Set log level to info, be more verbose
  -c CONFIG_DIR, --config-dir CONFIG_DIR
                        Select configuration directory ($HOME/.ceof by
  -a ADDRESS, --address ADDRESS
                        Address to connect to
  -p PORT, --port PORT Port to connect to
Get ceof at http://www.nico.schottelius.org/software/ceof/
The user interface can be started without any arguments:
```

# 3.3 Setup

#### 3.3.1 Retrieve Source Code

(python-env)[10:33] brief:src% ./bin/ceof ui

The source code of this project can be found on http://git.schottelius.org/?p=hszt/bachelorthesis and can be downloaded using git:

```
git clone git://git.schottelius.org/hszt/bachelorthesis
```

3.3. SETUP 29

#### 3.3.2 Install Requirements

The following requirements need to be provided to run the CS and the UI:

- Python >= 3.2
- python-gnupg module (required by ceof)

After Python >= 3.2 has been installed, the following steps are necessary to get the UI and CS running:

```
# Go to home directory
cd ~

# Get source code
git clone git://git.schottelius.org/hszt/bachelorthesis

# Create python virtualenv with Python3
virtualenv3 ~/ceof-virtualenv

# Create link to python3
cd ~/ceof-virtualenv/bin
ln -s python python3

# Activate virtualenv
. ~/ceof-virtualenv/bin/activate

# Install gnupg
pip install python-gnupg
```

#### 3.3.3 How to Run the Server and the UI

After the python environment has been setup, the server and UI can be started as following:

# 3.4 The User Interface ("'ui2user"')

This section specifies the appereance of the user interface to the user.

#### 3.4.1 Interface

The UI is running as a neurses application and prompts for input on a specific line.  $^1$  All commands start with "/".

Figure 3.1: UI Startup Screen

```
Trying to connect to 127.0.0.1:4242 ...
[Erno 111] Connection refused
Trying to connect to 127.0.0.1:4242 ...
[Erno 111] Connection refused
Trying to connect to 127.0.0.1:4242 ...
[Erno 111] Connection refused
DId not Manage to connect
```

#### 3.4.2 UI Command: /help

The /help command prints a short usage description.<sup>2</sup>

#### Example

/help

## 3.4.3 UI Command: /connect [host] [port]

The connect command can be used to connect to the chat server.<sup>3</sup> Host and port are optional. If omitted, the saved host and/or port will be used. This command uses message 2100.

#### Example

/connect 127.0.0.1 4242

<sup>&</sup>lt;sup>1</sup>Example output can be found in figure 3.1.

<sup>&</sup>lt;sup>2</sup>Example output can be found in figure 3.2.

<sup>&</sup>lt;sup>3</sup>Example output can be found in figure 3.3.

#### Figure 3.2: UI Help Output

ceof - 0.0.2

Trying to connect to 127.0.0.1:4242 ... [Errno 111] Connection refused Trying to connect to 127.0.0.1:4242 ... [Errno 111] Connection refused Trying to connect to 127.0.0.1:4242 ... [Errno 111] Connection refused Did not manage to connect Found command: help /help:

/connect [host] [port] - Connect to chat server
/quit - Quit this UI
/allquit - Quit this UI, Chatserver and all other UIs
/peer add (name) \* Gaddress) \* (keyid) - Add peer
/peer del (name) - Nelete peer
/peer send (name) \* Onessage) - Send message to peer
/peer send (name) \* (nemame) - Rename peer
/peer show (name) - Show peer

#### Figure 3.3: UI /connect

ceof - 0.0.2

Trying to connect to 127.0.0.1:4242 ... TCP connected to 127.0.0.1:4242 ... Rttempting logical connection ... Successfully connected

#### 3.4.4 UI Command: /quit

Request the user interface to exit. It will deregister from the CS. This command uses message 2101.

#### Example

/quit

#### 3.4.5 UI Command: /allquit

The UI tells the CS and all connected UIs (including itself) to quit. This command uses message 2199.4

Figure 3.4: UI /allquit

Trying to connect to 127.0.0.1:4242 ...
TCP connected to 127.0.0.1:4242
Rttempting logical connection ...
Successfully connected
Found command: allquit
Terminating chatserver and all UIs
Terminating ourself
> /allquit

#### Example

/allquit

# 3.4.6 UI Command: /peer add <name> <address> <keyid>

Add the peer with the given name name to the list of known peers.<sup>5</sup>

Table 3.1: UI Command: /peer add parameters

| Parameter | Type            | Description                                 | Example               |
|-----------|-----------------|---|-----------------------|
| Peer name | EOFsdt: name    | Name you identify the peer with             | telmich               |
| Address   | EOFsdt: address | Where we can make the first contact         | tcp://10.0.42.42:4242 |
| Keyid     | EOFsdt: keyid   | The PGP fingerprint of the peers public key | F27987E34E66          |

<sup>&</sup>lt;sup>4</sup>Example output can be found in figure 3.4.

<sup>&</sup>lt;sup>5</sup>Example output can be found in figure 3.5.

Successfully connected
Found command: peer
Available peers:
telmich
Hans-Jürgen

#### Example

/peer list

<sup>&</sup>lt;sup>10</sup>Example output can be found in figure 3.10.

3.5. CONCLUSIONS 37

# 3.5 Conclusions

All target objectives as described in the introduction have been reached. The user interface is running as a Python/Neurses based library, the chat protocol is based on a TCP connection with a fixed length string protocol. There are future tasks available that may enhance the usability of the UI:

- Support for command history (arrow up / down)
- Extend chat server from mockup to real implementation
- Support for line editing (delete / backspace, arrow left / right)
- Support for resynchronisation in chat server and ui

In addition to the expected results, all commands supported in the chat server have been verified by using unit testing.
